USER JOURNEY · HM-UX-001 · ONE MONTH, ONE FAMILY

A month with HridayMitra: Ramesh's story

Who uses it, when, for how long, and why they keep using it for months. Every light, score and reason below is the real output of our frozen engine on synthetic patient P0189 from the held-out test set. The people are fictional; no human data was collected.

90 s
a day for Ramesh, sitting down

0
reading, typing, apps or charging for him

4 days
of warning for him (median 3 on test patients)

₹4,890
home unit parts, under the ₹5,000 limit

Ramesh, 62 · the patient
Heart failure, home after a hospital stay. Retired farmer, speaks Hindi, reads little, no smartphone.
90 s a day · about 45 min a month

Sunita · family member 1
His daughter-in-law. Gets HridayMitra's SMS on a basic phone; replies 1 / 2 / 3 or a missed call.
a few seconds, only when it matters

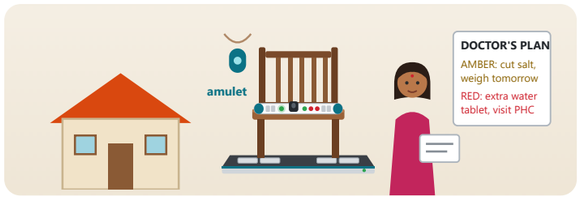

Kamla · ASHA worker
Sets up the platform and lap bar, gets a one-line Sunday SMS per patient, visits on red. Fits the home visits she already makes.
10 min once · then on red alerts

Dr. Meena · PHC doctor
Writes his amber / red plan once; it lives on the device. Called only if nobody has examined him within 6 hours.
5 min once · rare calls

1 Day 0 · back home

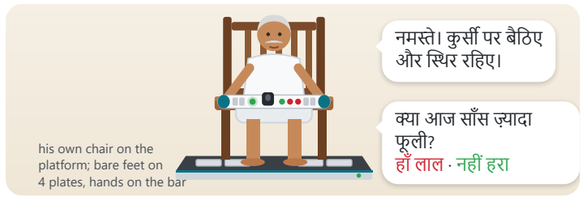

once · 10 min, by the ASHA

Dr. Meena writes his plan; **it lives on the device** and is spoken in Hindi. Kamla slides the weighing platform under **his own chair**, hands him the lap bar, **enrols him in one sitting** and puts the Kavach amulet on a cord around his neck.

2 Every morning, after tea

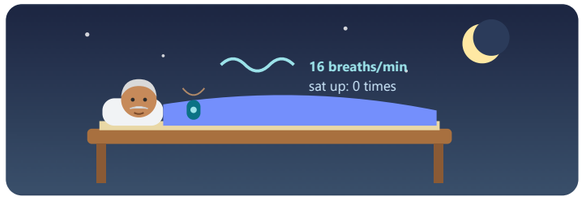

90 seconds

Weight, **leg and chest fluid through 8 electrodes** at 3 frequencies, finger pulse and SpO_2, stand-up time, and 3 spoken yes/no questions answered on the lap bar's ✓ / ✗ buttons. **Green light: "सब ठीक है".**

3 Every night, asleep

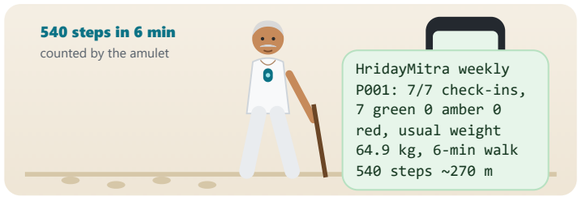

0 seconds

The amulet counts **night breathing** and **sitting up to breathe** (lying flat gets hard as fluid builds), detects a fall, and has an SOS button. It hands the night's summary to the platform by Bluetooth.

4 Every Sunday

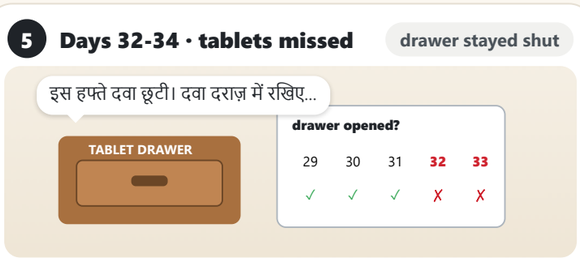

6-minute walk

HridayMitra asks for a 6-minute walk; **the amulet counts the steps itself**, with no button to press. Kamla gets one line per patient every Sunday, so she knows who to visit first.

5 Days 32-34 · tablets missed

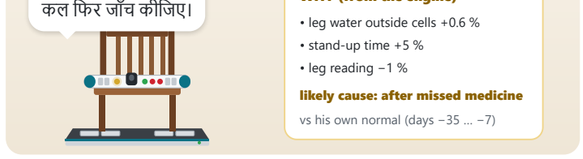

drawer stayed shut

A microswitch in the tablet drawer records whether it opened (real data for P0189: missed on days 32, 33, 34). The voice coaching tip: **keep the tablets in the drawer and take them after the check-in.**

6 Day 34 · AMBER

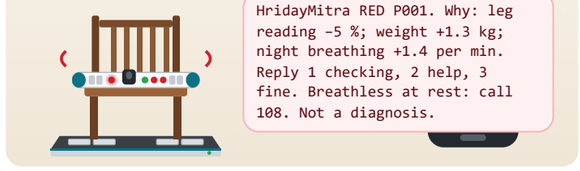

score 4.5 · amber at 4.2

Nothing urgent yet: **check again tomorrow and follow the doctor's amber plan** (cut salt). No SMS on a single amber, so the family isn't bothered. The 3-frequency index shows fluid outside the cells before the weight moves.

7 Day 41 · RED

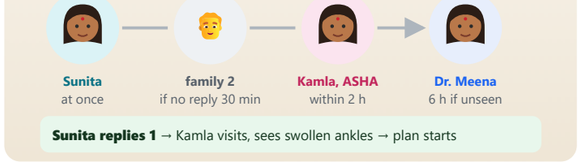

score 10.4 · red at 7.0

Red needs **two independent kinds of evidence** (fluid + heart-lungs here), so one wrong button can't raise it. Every SMS says **why**, fits one 160-character message and always keeps the 108 line.

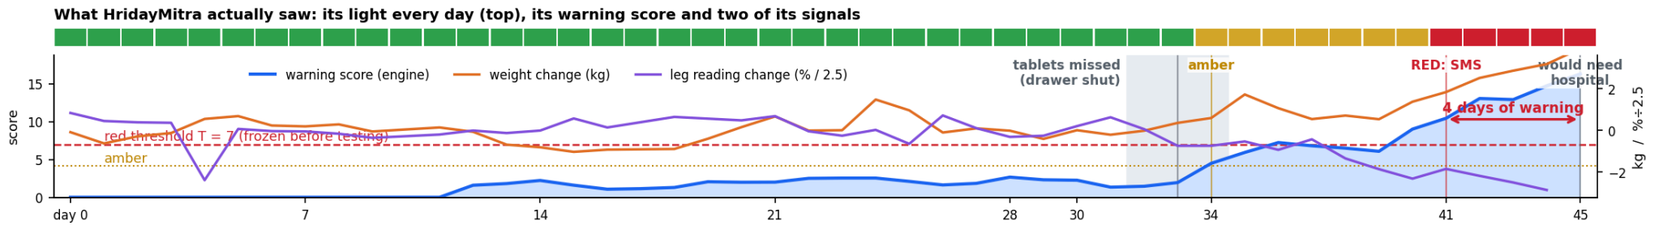

8 Day 41 · the care loop

hours, not days

The extra water tablet in his plan starts **4 days before he would have needed hospital care**. In our care-loop simulation, **92 % of red alerts** got a clinical review before the hospital visit, against 27 % with a single SMS.

What HridayMitra actually saw: its light every day (top), its warning score and two of its signals

Synthetic patient P0189, held-out test set, frozen engine v3 (T 7.0, chosen on training patients only). All 60 test patients: 66 % caught, 98.7 % of normal days quiet, median 3 days of warning, 0.06 false alerts per patient-month.

WHEN THINGS GO WRONG

Power cut	Runs on its battery; SMS wait in a queue.
No network	Light and voice still work; SMS retried every 10 min.
Guest sits down	Weight and legs don't match him: nothing saved.
Foot off a plate	"Your left foot is not touching its plate", then re-measured.
Fever, not fluid	Pulse up, fluid steady: "maybe an infection, see the doctor".
Skipped a day	No check-in by 11 am: reminder SMS to the family.
Pacemaker / ICD	Never on the plates: weight-only mode.

Why Ramesh is still using it in month 6

the PS asks: why will they keep using it for months?

HABIT
Tied to tea and tablets
Same seat, same time, right next to the tablet drawer. A habit he already has, not a new one.

EFFORT
90 s, sitting down
No patch on the skin, nothing to read, type, pair or charge. The platform charges overnight on CHARGE.

TRUST
Learns his normal
Compared only with his own days 35 to 7 ago. 0.06 false alerts a month, so nobody learns to ignore it.

CARE
It talks back
Hindi voice, his doctor's words, tips on salt and tablets, and a green "सब ठीक है" most days.

ASHA
Fits her rounds
Sunday summary + red alerts tell Kamla whom to visit first: less guessing, same visits.

FAMILY
Peace of mind
Sunita hears only when it matters, with the reason. The Saathi app shows the month for whoever wants more.

Monitoring, not diagnosis. Synthetic data only; no human data collected. Never used on anyone with a pacemaker or ICD.
